

Margaret McGuinn

This entire project should be rejected. From step 1, the process has been, at minimum, skewed, and every single commissioner who did not do their due diligence on this proposal should be replaced. The simple fact that NDAs were required by anyone in the county is very telling and evident that deals were being made that were not in the best interest of the community. Anyone who signed an NDA in relation to this project should also be replaced.

Data already exists showing the negative impacts of data centers on environments and communities; these impacts and dangers are not worth the empty promise of jobs - which are likely temporary, low paying jobs in much smaller numbers than promised. With 10 MILLION TONS of CO2 being released from a center such as this, an incredible amount of extra heat generation, depletion of water and other natural resources, as well as huge electrical uses and cost increases for average consumers, no matter what returns are promised, we can't afford it.

In the best interest of people and the community, reject this application.
