

Caitlin Rogers

Throughout my high school years I spent my time in FFA giving speeches about how New Mexico's water supply has fallen short again and again and how it has affected our farm use, easing animals, and our water use at home. Now about 3 years out of high school I still feel like i'm shouting for the same things. We need to save our water! Our state is already struggling to get the water we need with the Rio Grande getting drier every summer along with our lakes and creeks. The last thing our state needs is to have our water being used for something that is doomed to collapse in itself. Studies are finding that AI will not truly improve as it's running on its own data , data that already has gaps in its intelligence. These data centers are the opposite of an investment, it's actually will drain us.
