Allowing project Jupiter to be built without fully recognizing the implications of a fuel cell center at this scale in a community that will be impacted by its air pollutants is irresponsible and dangerous. Considering the air quality concerns and impact of the environment, I urge NMED to reject the air quality permit proposal and ask that data centers be assessed with much deeper scrutiny in order to protect people and the planet. The impact this data center would have on the community and landscape is too great a risk and concern to allow it to continue to be built. Let's please step back from the building these data centers until a better balance between technology and the future health of our communities and the environment can be achieved.
