I live in southwest Philadelphia and under no circumstances do I believe an AI data center as large as this one should be built. Rivers are drying up, due to multiple factors like greedy companies sure, but also due to increased ai usage. A single ai prompt uses approximately one bottle of clean water. Now multiply that bottle by the amount of people using ai in a day. Make that day a month. A year. We cannot create clean water, there is a finite amount of it on earth. If we run out of water then mass dehydration— and mass deaths for the poorer people— will shape society again and again until there is nothing left of the world we know now. Not to mention the carbon emissions this center would produce. Deforestation is still an ongoing issue that already threatens our oxygen supply without adding millions of unsafe to breathe gases into the air.
