

Lindsay Stomp

My family has lived in New Mexico for several generations. The heat waves that we are receiving every summer have become more and more blistering every year, lasting longer, and remaining substantially hotter when they do. My parents don't remember a time growing up where the Rio Grande was dried up for weeks at a time. In my lifetime, it comes with little fanfare. Because of this, I ask you to deny the Yucca Growth Infrastructure's air quality permits. New Mexico does not need more pollution. Project Jupiter is expected to release 10 million tons of carbon pollution into our airs, and therefore, into surrounding fragile environments, in addition to taking up hundreds of thousands of gallons of water that surrounding communities could benefit from receiving instead. Additionally, in communities that already live near data centers across the United States, many complain of constant humming noise that disrupts the ecosystem, drops in water pressure in surrounding suburban households, unknown smog coming from chimneys leeching pollutants into the air with no response from the companies themselves, and unclear tap water. These data centers may claim that they will leave no impact on surrounding communities, but how will we guarantee this is true? How will we guarantee the safety of Doña Ana County residents, when Doña Ana County has already been labelled as a "nonattainment zone", and therefore already do not meet several air quality regulations. Furthermore, Bloom Energy already has a history of illegally dumping hazardous waste. In such a fragile environment, how could this waste impact our biodiversity, or at worst, at what risk could this leave if this waste seeps into our precious groundwater? Our infrastructure for making sure our people have access to clean water in this state is already fragile. Think to a decade ago, when communities in northern New Mexico who relied on the Animas River were terrified that a precious water source had been taken from them. The public should be given an additional 60 days to review and comment on this air quality permit. The people of Doña Ana County deserve the chance to let their voices be heard, and if the permit is not denied, there needs to be a public hearing held in Santa Teresa, in both English and Spanish, to further allow the community to speak on this matter. When looking at this permit, ask yourself, do the benefits outweigh the risks on the community? Why should Doña Ana County residents suffer from this government-sponsored environmental destruction and racism. If Doña Ana County already struggles to meet federal government rules on air quality, how does Project Jupiter serve to make it any better? The simple fact is that it won't. Even with the money that Project Jupiter pledges to give to surrounding communities, there is still the strong estimation that it will produce ten million tons of carbon dioxide. Ten million tons, released into the atmosphere and into the air of surrounding communities. Children attending Santa Teresa Elementary School will sit innocently, every day, LESS THAN ONE MILE from this pollution. Three other schools, an elder care center, and three public parks sit within around 4 miles of this project. Deny this air permit. Gambling with the fragile health of our children and elders would be a complete defilement of the authority vested in you. Project Jupiter does not exist in a vacuum. Its environmental damage will be overwhelmingly negative, and it risks our most vulnerable in the process. To reiterate, a data center as large as Project Jupiter does not yet exist, nor does data for its environmental damage exist either. We are risking our communities for something that we have no proof will be safe for our residents to live beside. It is not worth the risk. Deny Project Jupiter's air quality permits, or guarantee harm to its surrounding communities and environment.
