

Tor Nichols

This project grossly impacts the health and well-being of the citizens of this area all for the benefit of a data center which minimally benefits the area. The fact is this generation will output 10 million tons of greenhouse gases and more than 100 tons of VOCs greatly worsening air quality in the area. We do NOT need a data center, but we do need clean air and plenty of water available.

I have not seen any enforced consequences for either this project or Project Jupiter if they go beyond what they're allotted. Instead they have verbiage that allows them to use more water than estimated because the language is so weak.

If it isn't clear, I am fully opposed to this project. There is no reason they couldn't use a mix of solar, wind, and battery storage. Burning natural gas is not environmentally friendly no matter what they got the local government to rubber stamp.
