

Sofia Flores

My name is Sofia and I live in El Paso, Texas. As a community built by the Rio Grande, a large Data Center such as this one will suck New Mexico's and nearby communities resources dry. The energy needed to power something like this alone would raise utility prices for the residents near the area. Not only that but for a community located in the desert, water is already a scarce resource and to use it on something as trivial and dangerous as a Data Center is reckless. Data Centers are also extremely loud, communities with already established data centers complain of the consistent noise pollution. It is an annoyance that no one in the community is asking for and that no one in the community needs. Please think of the carbon emissions that will come of the center as well as the impact this will have on the desert ecosystem.
