

Jena Ferguson

As a New Mexico resident I strongly oppose project Jupiter. The evidence is proving that data centers pose risks that can affect our clean drinking water, land and air quality. Our focus should be on reducing air pollutants, maintaining and ensuring access to clean water, reducing chemicals and contaminants to our land. Until enough research has been done - there needs to be a pause on data centers. The noise levels are proving to negatively impact nature and wildlife. Utility bills are also rising. There is not enough transparency to justify the risk these data centers create for our environment.
