

Wendy Kent

I object to the Project Juniper AI Data Center installation. Multiple data centers across the country have demonstrated their lack of respect and consideration for the community members located around the centers. Oracle now says it will use fuel cell technology to power the center. I admit that I do not understand how a data center would use "fuel cell" technology to run a facility by changing a question/answer event into a Job Fair! Somehow, the company will wiggle out of their "commitment to fuel cells" with one excuse or another and the center will have to connect to the grid. The local/state government will accept their lies and allow it to happen. Then the turbines will crank up and the air pollution will kick in. The center will suck up all the water and community members' wells will run dry or be destroyed so the water will not be decent to use. Electricity costs will skyrocket. Property values will drop. And the noise!!

I do not want any data centers in New Mexico.
