Artificial Intelligence is notoriously known to destroy the environment. This includes with air quality, water quality, water quantity, and various other pollutant factors. The creation of the "largest AI data center" would be detrimental both globally and locally. This should be stopped and shouldn't have even been a considered project. The public should have a say so on whether or not the data center should be built and a public hearing should be held in both English and Spanish with option of a virtual attendance for those not in Santa Teresa. An additional sixty days for the public to comment on this matter would be splendid.
