

Leah Montoya

Project Jupiter affect A lot of the times we as people always want the best even if it means prioritizing ourselves first but what happens when it affects not only the people but the environment around it? When looking at the project I understand the usage of AI and how it can help people and how it navigates data. I understand and sympathize with the fact that a lot of have needs to be meet whether it be by doing right or wrong it's human nature. The problem with this is that it affects other people, but not only is this going to affect other people. It will also affect the Earth itself. By creating this data center we are allowing more catastrophic events to happen or at least put more danger on earth than we have now. By creating this data center, you are basically saying that you don't care about what affects the planet and what it does to the people in it, if you already don't know half of the planet has already been affected by the usage of AI a.k.a. artificial intelligence. Some examples of put right here are lake Irwin in trucker Georgia Iran lake Irma it lost 90% of its water and it's critically overdrawn in 97% of Iran is affected by some level of drought. Texas Medina Lake, lake Wylie Falls North Carolina. The world's fourth largest lake lost 90% of its water. It had 40,000 tons of fish now all diminishing to zero all 24 species gone. Rio Grande dried up before summer even began and on top of that we have carbon dioxide which will be affecting our lungs. Not only our lungs, but our environment too the fruits and vegetables that we need for survival all of the things that we eat all the things that we see all of it would be affected more than it already has. So in conclusion, it brings me back to my question are you willing to find out what happens by creating the data center? Or are you willing to stop now and see what we can do better as a society to recover our environment?
