

Daniella Montanez

I am writing in decent of building YGI Micro-Grid, Project Jupiter, and any future micro grids for data centers.

I believe based on current statistics we have collected on similar projects, data centers can cause catastrophic damage to local communities with harmful noise production and the depletion of the water table in an already drought stricken area. This data center will add to the already compounding harm to the overall environment. These data centers are also poised to replace more jobs in the long term than they are currently creating.

I urge the New Mexico Environmental Department to vote against continued construction on Project Jupiter and consider the full environmental impact this project will have on the whole state of New Mexico.

Thank you for your time,

Daniella Montanez
