

Esther Smith

We do not need a bigger data center. Our planet is on the verge of no return, we didn't need AI before, and it's use disgusting.

Earth is three years away from not being able to return from the mistreatment from humans, and AI is boosting it. Data centers cause all sorts of different pollution, like light pollution, and noise pollution. It also takes a lot of clean drinking water which is already limited.

We went from stone tools to machines on our own, from horses to cars on our own so why do we need AI? All AI does is recycle information, it doesn't create anything new. It is only making us even more lazy than before, students rely on it for assignments making assignments an ineffective learning experience.

What AI is used for is disgusting. Deep fakes, trafficking, child pornography, and catfishing. It is horrible that there is so many people who use AI, and it's disgusting that many use it for things like this. AI puts others at risk without them knowing, since it cannot create something new, it's all recycled. AI music, and art is just stealing. Nothing is new.

In conclusion, we do not need a bigger data center. Our planet is on the verge of no return, we didn't need AI before, and it's use disgusting.
