I am asking you deny the proposed data center. There will be 14 million tons of greenhouse gases annually. This affects the air quality and puts lots of pollution. There will also be an enormous use of water. The campus would include 4 data center facilities. Filling 4 data centers requires about 10 million gallons of water and on going consumption would be 7.2 million gallons of water every year that it's operating. The project would use a daily average of 20,000 gallons of water when up-and-running and 60,000 gallons a day maximum. CRRUA said it produced an average of 2.6 million gallons of water daily. Residents lack trust of Sunland Park and Santa Teresa towards the project developers stems from the fact people have lived with low-quality drinking water supplied by CRRUA. Even if the water has been improved there was still a short notice and untrust.
