

Matt Ziegler

NMED should deny Yucca Growth Infrastructure, LLC-YGI Microgrid's air quality construction permit. Compliance will be difficult to implement and enforce with the current fuel cell design. The scale of the fuel cell project is untested and there are too many unknowns on how this will impact emissions. Modeling of the design is based on the applicant's data and is not transparent. The significant production of CO₂ and VOC emissions will impact and continue to marginalize our residents and communities most at risk including my own family members that live in Doña Ana county. In addition, the companies involved in the proposed fuel cell project are already significant non-compliers when it comes to environmental regulations. This project does not support the people of New Mexico.
