

## Caleb Ross

I am opposed to Project Jupiter and urge the New Mexico Environment Department to carefully consider its long-term impacts before approving additional permits.

New Mexico already faces serious challenges with water availability, and I am concerned about the amount of water a massive data center project could require over its lifetime. Once these resources are committed, local communities may be left dealing with the consequences for decades.

I am also concerned about the project's energy demands and potential air pollution. Even with proposed changes to the power plan, this development would still require an enormous amount of energy and industrial infrastructure. The environmental costs should not be overlooked simply because the project promises economic benefits.

In addition, I worry that local residents will bear the risks while large corporations receive most of the rewards. The state should prioritize protecting our natural resources, public health, and future water security before approving projects of this scale.

New Mexico's environment is one of our greatest assets. I believe the state should take a cautious approach and require thorough review and public accountability before allowing this project to move forward.
