The proposal of Project Jupiter is a massive harm to our climate and environment, as it will be one of the largest data centers in the world. The project seems it wants to exhaust the stack of every fuel cell. With the exhaust of fuel cells tons of carbon monoxide will be released into our environment, which will harm our air quality and health for future generations as they will not get the same privilege of just being able to breathe in clean air. Children who attend Santa Teresa Elementary who sit down in their seats innocently and with the intent of learning will have to deal with the data center every day which is no further than one mile. Putting these kids at risk. Three other schools and children will be put at risk, attending school with risk of breathing harmful air. Another concern about the project is that it seems to lack control and supervision. Plus, the lack of information we have about it. A few concerns being; what data was used to train these models? When and where was this data collected? What proportion of those involved in the development of this model have, at any time, received money from the corporations involved? The project seems to have cut corners and submitted lazy statistics and tests about just how much pollution they were putting out. These two reasons should concern the community around Project Jupiter. Schools, families, towns and cities will be affected by the project. Whether it be by terrible air quality or the lack of water the community is about to face. It is only a matter of time.
