

Phillip Himel

To NMED public comment recording Staff... I live in Southern New Mexico, I realize this project looks like may appear as an economic godsend... But I believe the scale of the project is out of proportion to the available resources of the region. Land area is abundant...but that is not critical to long term human community needs such as water. Water is key for the city and towns for dwelling and agriculture purposes... We can't eat data center product. I believe more study is needed... I believe that outside corporations promising outcomes benefitting the existing communities that are "too good to be true" are likely to be less than fulfilling of those promises... There is the possible increase of greenhouse gases and heat island effects that are equivalent to 3 new Mexico cities combined... That effects us regionally, and globally... All this investment, and Roswell can't get airline flight service to more than Dallas...we need new energy production and Transportation paradigm shift... Not data centers.
