

## Trina Witter

I'm writing to ask that you deny the Project Jupiter air quality permit application. Even though they switched to fuel cells they will still be emitting 10M tons of pollutants that are hazardous to human health. That is simply unacceptable in a region that already has some of the worst air quality in the nation. As a resident of Doña Ana county for over 40 years I've seen how the air quality has become worse and worse from manufacturing and climate change. Particulate matter from dust storms/haboobs, auto emissions from long wait times at the border, and now emissions from hyperscale data centers have long term health effects on residents. Please don't let residents become victims of big tech who are only here to take advantage of residents. Help NM to be a leader in clean green sustainable energy. If it can't be denied please add an extra 60 days so residents can continue to ask questions about Bloom and their fuel cell technology.
