

## Ezra Moon

The change to SOFC energy generation may have reduced the amount of GHGs, but the quantity of emissions is still unacceptably high. Even without considering the numerous other issues data centers like this cause, the emissions are bad enough to outweigh any supposed benefits of the project. While the project will barely provide any direct benefits to New Mexico, it will cause direct damage to local communities, and will only contribute to issues like climate change and water scarcity, which is why this permit should not be approved.
