

Clyde Miller

As a lifelong resident of Doña Ana county, I in no way want a large scale gas-powered fuel cell power plant to be built. Our community already struggles with poor air quality and rising temperatures and UV. Building this plant will only make things worse. The community that makes up Doña Ana county is so special and I would like for future generations to continue experiencing and growing the community. The long-term effects from these plants would not allow for that to happen. Additionally, it makes absolutely no sense to build a plant in an area where water is already so scarce. The amount of water these plants will use will significantly affect the availability of water in the county, further impacting this community. Building all of the pipelines needed for these plants would disrupt the natural infrastructure and would result in more risks to polluting the water and the air if any were to fail.

Yucca Growth Infrastructure MUST be transparent with the residents of Doña Ana County and stop promoting these plants as an "environmentally safer" alternative. These plants will cause long-term, irreversible damage to this community.
