

Catalina Ambriz

The fact that there's the amount of pushback from this project and yet there is still a foolish push to put a data center that will require massive amounts of water that should be used for people, land, and animal is disgusting amongst so many other things. We, the people of New Mexico, are vehemently against the proposition of this project. Those who are in charge who are so quick to consider selling off our precious, beautiful land for a quick paycheck should be disgusted with themselves. Project Jupiter keeps making claims that they can't even back up. One thing is for sure, our future generations will rely on maintaining the ecological systems in place over a handful of temporary jobs. More specifically focusing on air quality, the data center will raise temperatures in nearby surrounding areas within a 5 degree radius. The environmental impact of this project will have a detrimental effect on the future of New Mexicans. WE DONT WANT IT STOP TRYING TO PUSH IT DOWN OUR THROATS. The weather outside is unbearably hot and the Rio grande is bone dry, in what world does it make ANY SENSE to put a data center that requires so much water in the DESERT during years of record levels of DROUGHT.
