

Jac Crespín

I'm generally in favor of technology, especially when it helps with education, new ideas, and responsible growth, but approving Project Jupiter without really understanding what it could do is not a good idea. Technology should help people make better decisions, not replace careful thinking or ignore possible problems, especially with the risks to air quality, water use, and public health in an area that is already under pressure. There isn't enough transparency in the process, and important information about emissions and environmental impact is missing. They need to deny this permit, because New Mexico shouldn't move ahead with a project that could hurt its communities and natural resources.
