

Judy Scarbrough

I am opposed to accepting the application of Yucca Growth Infrastructure, LLC. for the air quality construction permit. Data centers require an enormous amount of energy to power them. On-site (and off-site) power sources emit carbon dioxide fueling climate warming emissions. On-site power sources will generate fine particulate matter that risk the health and well-being of New Mexicans near and far; these particulates travel unpredictably. Additionally, it seems an unwise decision to place a massive water-guzzling data center in a desert in the midst of a long-term drought. I do not believe the economic benefits to New Mexico outweigh the risks to the health and well-being of our people and our planet.

Sincerely,
Judy Scarbrough
