

Teddy Gaylord

This unnecessary data centre will release 10 million tons of carbon dioxide annually, which will contribute to climate change, which is already extreme enough. The Ozone Layer is healing! Let's let it heal and let's help fix our earth so we can actually live in it. The Rio Grande has also dried up, even before summer, because of this. Building this data centre would threaten our water supply. Water is supposed to be renewable. It's becoming non-renewable because of your data centres. Communities, human or not, heavily depend on this water to survive.
