

Christine Santopolo

I oppose granting this permit. As the Los Alamos Daily Post noted, "Data centers, like the proposed Project Jupiter, use massive amounts of water in order to operate and across the nation, create an immense strain on local electricity grids and public water supplies; increase electricity and water bills for both local residents and businesses; and significantly increase noise, light, air, water, and soil pollution in neighboring communities. Project Jupiter, alongside its proposed microgrid, natural gas power plants, battery storage center, and desalination plant, is seeking to make its home in Santa Teresa, where community members have already lacked access to clean, safe, and affordable drinking water for decades."

We don't have sufficient resources for New Mexico residents, we can't afford to give them up to data centers that have proven in many other places to be bad neighbors.
