

Ally Pavelec

I have now lived in most of the areas that would be affected by this data center. I've lived in El Paso, Las Cruces, Santa Fe currently and I will be moving to Albuquerque. This data center is terrible and against humanity for many reasons. All these areas that I have lived in have water quality and quantity issues, wildlife protection needs, and extreme weather. This data center will increase the temperatures of already hot areas, and the rest of the facts that are necessary are not given: how much waste, what kind of waste will be produced, that fuel cell tech will work at that scale, that the air won't be polluted creating more extreme weather for these communities. We have signs all the way up here next to the mountain in Santa Fe still asking to reduce water use and I know very well that this data center would not be held to the same standard we have been held to for decades. This is only to like rich people's pockets with more money and this is a state filled with wildlife conservationists and humans who care about each other's well being. This data center has no right to be here and no one in any of these cities in lived in want this either.
