

## Nina Crawford

Project Jupiter is not an asset to NM. Look at other cities and states that have these data centers added to their communities. They are known to strain the power grid (even with "their own power supply") causing rate increases. In a state that can barely handle the rent increases, an energy rate increase would be devastating. Some cities that have installed these data center are putting water bans on people and plants. People require water to live. Food sources require water to grow. The centers should have the bans but it is shown over and over to have the burden on people, animals, and plants. Our dry climate makes pollution more extreme. Running non-stop, power hungry machines will cause air pollution. Residents in Tennessee are planning to sue for the air pollution building in the community around a data center. They also offer noise pollution to the community. The data centers also start with hiring and creating jobs, which sounds good. But once the system gets running their are lay offs and the long term positions with high pay are limited. Many data center will have fewer than 100 employees, and down to 25 employees. These are not jobs that will help the community. Plus, many of these employees are moved in from other cities and states. Then, if the data center moves the community is stuck paying the cost for the infrastructure for a facility that isn't even active.

Please, keep Project Jupiter out of NM.
