

## Arjan Tafoya

The switch to fuel cell technology won't fix the glaring energy problems for the data center. The tech is unproven at large scale, produces hazardous waste and more greenhouse gases than Santa Fe, Abq, and Las Cruces. Not to mention all the water it would consume. First you said 20,000 gallons a day, then you said a million gallons a day, which is it? We don't have any water anyway, why the hell are we giving it to data centers
