

Leoh Forsyth

Open AI severely raises carbon emissions and not only makes life harder for those already struggling, but all life on planet Earth. Even before Data Centers came into discussion, greenhouse gas emissions were already at an all time high from combustion, livestock, and overall human behavior. These greenhouse gases have increased the overall temperature in planet Earth, causing Glaciers to melt, the ocean levels to rise, and habitats to be destroyed. With the addition of data centers, we worry not only for animal populations, but human populations as well. Many cities are near sea level and could be flooded or completely swallowed by water. Many citizens may begin to worry about clean water or a normal supply of it. Increased temperatures can cause an increase of melted plastics and microplastics in food, water, and the human body. The change in temperature may also affect livelihood of plants and farms. Severe weather events like tornados or hurricanes may become more common and more severe, causing more damage and destruction than ever before. The increase in temperature is beginning to affect those without air conditioning, in Western Europe we see temperatures near an all-time high. In Detroit, many people without AC are becoming desperate for relief. Data centers will add to the already severe problem of Climate Change and Global Warming, I speak for the general population when i say that we do not want or need this. Stop thinking about money and ease of work and think of the people already struggling in poverty, homelessness, and a lack of ability to escape the heat or the storms that come with it. Soon enough, money will not be able to save you either.
