

Alexandrea Thomas

The carbon dioxide pollution alone will heat our atmosphere at a much faster pace and promote the formation of even more ground-level ozone. This will affect billions including, my best friend who suffers from seizures when too hot. This is a very traumatic situation for her that could easily become an everyday thing for her ultimately forcing her to stay inside and miss out on opportunities that there's of our friend group can take. Allowing this to happen would bring the value of life for my friend and people like her to an all time low. Life reduced to seizures, isolation, little life experience, and severe mental health issues. Both of my brothers who are diagnosed with autism, one severe and one functioning would also be extremely affected by this. My severe brother has always had a love for being outdoors. It's been the only place that we have seen him noticeably deescalate from a serious breakdown due to overstimulation. This rise in heat may take away his one safe place due to the overwhelming and inescapable sensation of heat. This would prohibit him from experiencing the things that calm him down due to fear of seizures and heatstroke. My other brother is obsessed with boats and being on the water. This would also have to unfortunately stop due to the sun reflecting off of the water putting my brother and everyone else on the boat in immediate danger. The other toxic air pollutants are extremely dangerous—many of them at very low levels. This would immediately effect billions of people with chronic health issues and lead to a severe increase in of people in the hospital potentially taking up space from people with other emergency's including those caused by the heat, air pollutants on top of the preexisting issues. Where is my brother and best friend supposed to go when prompted by their health issues regarding seizures from the heat? How will we pay for these constant medical bills?
