

Ashley Wegele

I am against approving the air quality permit application for Yucca Growth Infrastructure. 'Project Jupiter' is one of the last things our state needs. Air quality is already poor due to ozone, wildfire smoke, and other pollutants throughout the year. Water is a scarce resource that is becoming more so every year. Even if one IS broadly in support of AI - the rapid increase of ultra large data centers being proposed is highly suspect given that our current level of AI functioning with the infrastructure already in place seems to be sufficient. What good is any of this when we are all too sick to use it or the water is finally all gone?
