Students, like myself, spend around 12-16 years in school, gaining an education and understanding of the world around them. AI is an unnecessary tool if you are able to receive a proper education. AI will put a hindrance on human ability to learn, not to mention the many other aspects in which it will poorly affect the world around us. AI is marketed as a tool to make our lives easier. However, because of AI, I am unable to find a job in graphic design post-grad. Why are robots creating art and not working in factories? Climate change has reached a point where it is essentially irreversible. Why do more harm to the Earth? UNNECESSARY harm at that. All data centers do is use up our limited supply of freshwater and spit it out as unusable garbage. Data centers raise the temperatures of the cities around them. When you are in a relationship with another human, deciding if it is going to work out, what do you do? You weigh the pros in the cons. And in order to stay in that relationship, the pros should significantly outweigh the cons. Human relationships with AI are overwhelmed with more bad than good. So why would we continue that relationship, risking the integrity of young minds, jobs, and most of all, our environment. Movies and shows have been warning us of this robotic rise for too long, and we ignore it and continue blindly. Without laws. Without regulation. Think about this.
