

Shalese Lovell

Creating a microgrid isn't getting rid of the environmental problem that a massive energy production facility creates. In fact, it proliferates emissions by condoning wilful blindness - this facility will NOT be constructed eco-consciously, nor will any of it be directly beneficial to NM residents. If this facility causes an increase in commuting, it will also become a social and economical problem, as we are currently facing an oil shortage during an economic downturn and active war. This greedy act will set the precedence for how New Mexico handles AI - while in the right hands it is a necessary tool of the future, private monopolization of tech that is on the equivalent scale of atomics should ESPECIALLY be opposed in our times.
