

## Clay Lindstrom

We simply don't have the water. We have been having wildly intense droughts that are lasting longer and longer. We don't have the power for it either. Why are we building a super intense water use and in need of extreme cooling in a desert that's hot for 9 months of the year? What happens when they inevitably lie and either poison the water or are using significantly more than allotted? Who pays for clean up? Who enforces actual water usage? What happens if poor rural communities wells dry up? They are lying for profit and we cannot afford to risk the water. Also why do their usage amounts keep changing drastically? They don't know what they are doing
