I live in Las Cruces, New Mexico. The Land of enchantment; and entrapment because man, there is something so captivating about the nature of this state. This is because we try our best to keep it the way it was before civilization, beautiful. New Mexico runs a very tight program when it comes to littering, so much so that theres some pretty hefty fines for throwing a candy bar wrapper on the side of the road, however, Fuel cells also create a very hazardous waste and the fuel cell provider for project Jupiter has a history of illegally dumping this waste and hiding it for several years. Furthermore, the carbon dioxide pollution ALONE will heat our atmosphere at a much faster pace and promote the formation of even more ground-level ozone. To add 10 million tons of carbon dioxide pollution and toxic emissions to our already bad air with our metro area currently being the 16th worst in the nation for ozone pollution not to mention we have received a failing grade on this air quality standard every single year since 2000. It is beyond unacceptable to invite a new source of SEVERE air pollution into our home we've been taking care of for a couple hundred years and will continue doing so by stopping this project. To build this data center is to create a threat to all the future future families residing in NM, ESPECIALLY the children attending Santa Teresa Elementary School who will every day, walk, play, eat, and sleep LESS THAN ONE MILE from this pollution. Three other schools, an elder care center, and three public parks all sit within around 4 miles of this project. We also have to take into consideration the dangers of an incident occuring at this center. Highly flammable hydrogen under high pressure only needs a microscopic crack to leak out, ignite, explode, and level entire neighborhoods and schools while sending shockwaves into nearby counties. to put such a massive hazard even anywhere remotely near a community would be unbelievably careless. To put into reference the size of Worldwide, Bloom Energy has developed 1.4 GW of fuel cell technology across more than a thousand locations, yet Yucca Growth Infrastructure is asking for nearly double that (2.46 GW of fuel cells) at a singular location. The largest fuel cell plant in the entire world is more than 30 times smaller than the fuel cell plant under consideration in Santa Teresa. This data center will take a MINIMUM of 1 MILLION gallons of water PER DAY. To build something that requires that much water in a state that has a VERY LIMITED SOURCE of water sounds nothing short of unreasonable, short-sighted, and barbaric. so please, for the sake of the community, STOP PROJECT JUPITER!!
