

Sophia Davis

This data center can not be built. This could permanently destroy ecosystems, killing so many living creatures that one may not even think about. With the release of carbon dioxide, sea levels will rise. Animals will die and coastal cities will begin to sink under sea level, destroying cultures and communities. Heat waves will get worse, and millions will die. If larger data centers are built, more electricity is used, and that means families will not be able to use electricity to cool off, rendering them vulnerable to the heat. This data center has more cons than pros. This will only positively affect the 1%, but in the end they won't even be able to see the fruits of building the data center. It will be a short-lived victory.
