Im just going to start this with how unnecessary this data center is, the data center that you all are currently building has so many flaws that i believe aren't being taken into consideration, the high amount of greenhouse gases going to be released is already concerning enough, your building a center in an area that already does not meet national air standards and is already being polluted to its max. Building something that we didn't need or changing how its built or how it's run doesn't change the fact that it still is dangerous for the people living in the area or the elders and children that have fragile health, you are putting thousands of people at risk and are not proving in any way that this data center will be good for anyone even the people who are willing the construction of this data center on, you are bringing more risks to an already fragile environment and world. Thousands of people will and are being impacted by project Jupiter even before its construction began, Rio Grande is already drying up before summer even started and continuing project Jupiter is just bringing on and allowing climate change and global warming to continue its life threatening and environmental impacts on to its max, our world and people can only support so much and continuing construction for project Jupiter would only be selfish and gives people no more reason to trust or believe that adding onto global warming for a data center is good for anyone.

Over 47,000 animal species are already being impacted by global warming and have moved from being vulnerable to endangered and you are adding on to this problem and if that data center is done building it will only bring those species from already being endangered to critical endangerment or even extinction, these animals play big roles in our life and the world that currently surrounds us, continuing project Jupiter would only mean that those animals will go extinct and cause even more harm to entire food chains and ecosystems.

If that sudden change happens then you are not only endangering those animals and ecosystems but humans that you think rely on that data center. In the end you are harming more them just ecosystems but yourself that "rely" on project Jupiter and the food, water, and air that everything on this planet needs.

You may think that building this data center "isnt that serious" but it is, animal species have gone down by more then 50%, droughts and trouble growing crops has tripled and areas struggling to have sufficient amounts of water has also gone down by more then 30%, air pollutants and the amount of CO2 in our atmosphere have gone up by 25%, people struggling with fragile health due to air pollutants is rising especially in new Mexico where project Jupiter is being built. Stop project Jupiter before you do irreversible damage to the world we apparently love.
