

Joshua Wallace

As I understand, the microgrid that would be enabled by this permit will have carbon dioxide emissions on par with that from both of New Mexico's biggest cities.

These cities have well over half a million residents, and tons of businesses within them. Hundreds of thousands find employment within that level of CO2 emission.

The proposed micro grid would power a data center that, compared to these two cities, produces almost no jobs (once construction is complete) and produces almost nothing for New Mexico, but instead exports data out of our state with very little financial benefit for us.

If we are going to allow that much additional pollution in our state, we have to get something out of it that's worth it.

I ask that you reject this permit.
