Just because this project is supposedly a 'cleaner' data center doesn't mean a better future for AI data center builds. Dozens of communities have already been impacted by previously built data centers beyond water and air pollution, and more communities and neighborhoods will continue to be effected as these initiatives grow to put more money in the pockets of the rich. This one data center may be cleaner, but other centers in other parts of the country are under no obligation to do the same, and so, there will be more of these environmentally unfriendly constructions. Sound pollution is an additional concern of data centers. The fall of academic integrity is partially attributed to the popularity of AI. So far, the cons of AI have yet to outweigh the pros, and so I ask Doña Ana county to reconsider this project one more time.
