Hello, I'd like to oppose the idea of 'project Jupiter', as i believe that this will most likely ruin the planet and our ecosystem even more than it is already. My first point is that the power plant will release up to 10 million tons of warming greenhouse gasses - this will contribute to climate change horribly and will singlehandedly erase all the progress we have done to reverse it up until now. Second, this is more greenhouse gas pollution than New Mexico's three largest cities combined - as you may know, that is an incredible amount of pollution and adding onto it is definitely a big mistake. I believe that this planet is already suffering enough, people are already dying from the heat and animal species are going extinct because of climate change - people are actively trying to make the planet a better place, trying to fix the damage and what project Jupiter is doing is the exact opposite - i believe we can survive without AI and many other people share my opinion - we don't need another AI database - it's either that or our only home, the planet that lets us live and the reason as to why we haven't gone extinct so long ago - the Earth. I believe the correct choice is obvious here. Save the planet. Save our home.
