

Sierra Sorensen

I strongly oppose Project Jupiter and the continued expansion of large-scale data centers. We have reached a point where our planet cannot continue sacrificing more land, more water, and more energy to support endless digital growth. Instead of building more data centers, we should be reducing our dependence on them, improving the efficiency of existing technology, and beginning to restore the land that has already been developed. Every new data center consumes valuable resources and permanently changes the communities and ecosystems around it. As artificial intelligence and cloud computing continue to grow, so does the demand for electricity and water. At a time when we should be protecting our forests, wildlife, clean water, and climate, expanding this infrastructure moves us in the wrong direction. I believe we need to shift our priorities. Rather than continuing to construct massive data centers, we should invest in reducing unnecessary demand, restoring natural habitats where possible, and giving something back to the planet. Economic growth should never come at the cost of the health of our environment or the well-being of future generations. Please stop Project Jupiter. Choose a future that values clean air, clean water, thriving ecosystems, and healthy communities over unchecked technological expansion. Our planet deserves restoration, not more industrial development.
