While it is a slight improvement to use natural gas fuel cells instead of consumption it doesn't solve the core of the issues with this AI datacenter. There will still need to be incredible amounts of natural gas extracted from the earth in very damaging ways to power this data center. Developers are still expecting 10.1 million tons of greenhouse gas emissions from this project, which is down 29% from the original proposal but is still almost double the emissions of the city of Albuquerque. I urge you to still reject this disastrous proposal and protect our environment and our health.
