

Stephen Libicer

There is no justifiable reason for this project to continue in southern New Mexico. This is an obvious threat to the long-term environmental stability of all of south central New Mexico, considering Bloom Energy's unfavorable history regarding the disposal of hazardous waste. But more critical is the threat this project presents to existing water supplies and tables, and the surrender of future generations' water access and use for a project that presents absolutely no compensative benefit for our state. If for any reason this permit is not denied, a public hearing with virtual access should immediately be held to announce it and allow public participation.
