

Rachel Langer

The idea that trading our precious water, air, land, and nature for ≈ 750 jobs—promised by companies that have so far been at best deliberately opaque and at worst outright dishonest in their applications—is unacceptable on its face.

There is no price high enough to make the destruction of resources required for human survival justified.

But on top of that, this project is *intended to replace human labor long-term*. That is the point of AI infrastructure. To eliminate as many human jobs as possible, by using and contaminating our shared water, land, and air to support their cognition factories.

Allowing this project to continue is sacrificing—for the benefit of a handful of out-of-state stakeholders—the environment that New Mexicans need to support all other economic activity and for the sustenance of life itself here in our desert home.
