

Elizabeth Bennett

Hello NM Environmental Department. I am writing to express my extreme concern with which the matter of Project Jupiter power supply has been handled. My primary concern is that there has been no environmental impact study done on the potential harm of the fuel cell technology, which as I understand will be the largest fuel cell operation to date. I would rather not suffer the consequences of such a grand experiment especially without any forewarning of how we may be impacted. I also understand the fuel cell technology emits large quantities of CO₂ which we are all aware is an air pollutant contributing to the dramatic propulsion of climate change. It is so irresponsible to allow major corporations to circumvent data driven environmental regulation.

It is also my understanding that Project Jupiter parent company Oracle has spend loads of money trying to influence public opinion, including hiring canvassers who have been documented filing false comments on behalf of individuals without their knowledge. This is a clear manipulation of the process that this body should investigate.

Please uphold your duty as a department charged with the protection of our environment.
