

Daniel Roper

I strongly oppose the Yucca Growth Infrastructure, LLC-YGI Microgrid Air Quality Construction Permit Application. While fuel cells are comparatively clean in emission of fine particulates, they are in no way "green" as they are powered by fossil fuels and emit large amounts of CO₂ - this at a time when we should be reducing CO₂ emissions. Add to this Project Juniper's enormous demand for electricity (more than half of a city like Las Cruces) for a technology that brings relatively few permanent jobs and has shown itself to offer little to the average citizen, and the cost in environmental damage is clearly not worth it.

Please reject the Yucca Growth Infrastructure, LLC-YGI Microgrid Air Quality Construction Permit Application. Please do not sell out New Mexico.
