

Stephanie Norwood

AI data centers are detrimental to the environment. Consider the water usage of such a center. Consider the dry Rio Grande. Building an AI data center in New Mexico is a slap in the face to those who are impacted by the lack of fresh water available. Further, data centers produce emissions via electrical use (which often is not produced in an eco-friendly manner). Project Jupiter promises economic growth at the expense of the environment. This promise of economic growth preys upon the economic inequality felt by residents of New Mexico, hoping that we are too ignorant to realize that this company does not care about New Mexicans.
