Project Jupiter is a direct attack to New Mexico's limited resources. With a lack of recourses already in the desert, such as the water planning to be used, air quality will decrease to an even lower number. New Mexico faces severe drought as of today and no proposed 'changes in technology' will make this data center better. Unanswered questions about the amount of water this project will use is a clear sign that this project is not sustainable or safe for the people. Due to all of these known issues about this project the public needs to be given an additional 60 days to decide whether construction should continue or whether the project should be stopped completely.
