

Valentina Ferrada

We don't need more sound, light, land or water pollution, we are already in a state of drought, we can not use the little water we have to cool down machines, the jobs you offer are temporary these sites run with very few employees the rest is all computerized, the people mostly affected by this are in rural areas and of lower income because the land is cheaper to buy, these people already struggle financially we don't need to put them at risk for health issues that we have yet to find out these data centers will cause to them asides from taking their water contaminating their land, and driving away all animals and insects that keep their surrounding areas and plants alive because thousands of machines make noise all day long. And you guys as a company already have a very shady background; we don't trust you with the lives of people and those are the lives you will be affecting with these satay centers.
